U.S. SERIAL NO. 10/038,872
PATENT

IN THE CLAIMS

The status of the claims is as follows:

1. (Previously Presented) A controller for allocating call identity values to call connections associated with a switch, said switch capable of handling call connections between calling devices and called devices on a plurality of trunk lines associated with said switch, said controller comprising:

N call application nodes capable of executing a plurality of identity server applications that allocate call identity values to said call connections, wherein a first one of said plurality of identity server applications is executed on a first one of said N call application nodes and is associated with a second one of said plurality of identity server applications executed on a second one of said N call application nodes separate from said first call application node, said first and second identity server applications thereby forming a load sharing group server application, and

wherein said first identity server application comprises a first primary-backup group server application, wherein said first primary-backup group server application comprises a first primary identity server application executed on said first call application node and a first backup identity server application associated with said first primary identity server application and wherein said load sharing group server application receives a call identity request from a new call process being executed in said switch and selects one of said first and second identity server applications to allocate a call identity value to a new call connection associated with said call identity request according to a load distribution algorithm.

DOCKET NO. 2002.02.004.NS0
U.S. SERIAL NO. 10/038,872
PATENT

2. (Original) The controller as set forth in Claim 1 wherein said first identity server application allocates call identity values having a first contiguous range and said second identity server application allocates call identity values having a second contiguous range different than said first contiguous range.

3. (Previously Presented) The controller as set forth in Claim 1 wherein said load distribution algorithm distributes new call identity requests in an alternating manner between said first and second identity server applications.

4. (Previously Presented) The controller as set forth in Claim 1 wherein said load distribution algorithm distributes new call identity requests according to a current processing load of said first identity server application and a current processing load of said second identity server application.

5. (Original) The controller as set forth in Claim 4 wherein said load distribution algorithm distributes said new call identity requests in order to maintain said current processing load of said first identity server application at a level substantially equal to said current processing load of said second identity server application.

DOCKET NO. 2002.02.004.NS0
U.S. SERIAL NO. 10/038,872
PATENT

6. Cancelled.

7. (Previously Presented) The controller as set forth in Claim 1 wherein call state information associated with said first primary identity server application is mirrored to said first backup identity server application associated with said first primary identity server application.

8. (Original) The controller as set forth in Claim 7 wherein said first backup identity server application resides on said first call application node.

9. (Original) The controller as set forth in Claim 7 wherein said first backup identity server application resides on a call application node separate from said first call application node.

10. (Previously Presented) The controller as set forth in Claim 1 wherein said second identity server application comprises a second primary-backup group server application, wherein said second primary-backup group server application comprises a second primary identity server application executed on said second call application node and a second backup identity server application associated with said second primary identity server application.

DOCKET NO. 2002.02.004.NS0
U.S. SERIAL NO. 10/038,872
PATENT

11. (Original) The controller as set forth in Claim 10 wherein state information associated with said second primary call process is mirrored to said second backup call process associated with said second primary call process.

12. (Original) The controller as set forth in Claim 11 wherein said second backup identity server application resides on said second call application node.

13. (Original) The controller as set forth in Claim 11 wherein said second backup identity server application resides on a call application node separate from said second call application node.

DOCKET NO. 2002.02.004.NS0
U.S. SERIAL NO. 10/038,872
PATENT

14. (Previously Presented) A wireless network comprising:
a plurality of base stations capable of communicating with a plurality of mobile stations
in a coverage area of said wireless network; and

a mobile switching center coupled to said plurality of base stations and to a public
switched telephone network by a plurality of trunk lines, said mobile switching center comprising
a controller for allocating call identity values to call connections associated with a mobile station,
said controller comprising:

N call application nodes capable of executing a plurality of identity server
applications that allocate call identity values to said call connections, wherein a first one
of said plurality of identity server applications is executed on a first one of said N call
application nodes and is associated with a second one of said plurality of identity server
applications executed on a second one of said N call application nodes separate from said
first call application node, said first and second identity server applications thereby
forming a load sharing group server application, and
wherein said first identity server application comprises a first primary-backup group server
application, wherein said first primary-backup group server application comprises a first primary
identity server application executed on said first call application node and a first backup identity
server application associated with said first primary identity server application and wherein said
load sharing group server application receives a call identity request from a new call process
being executed in said switch and selects one of said first and second identity server applications

DOCKET NO. 2002.02.004.NS0
U.S. SERIAL NO. 10/038,872
PATENT

to allocate a call identity value to a new call connection associated with said call identity request according to a load distribution algorithm.

15. (Original) The wireless network as set forth in Claim 14 wherein said first identity server application allocates call identity values having a first contiguous range and said second identity server application allocates call identity values having a second contiguous range different than said first contiguous range.

16. (Previously Presented) The wireless network as set forth in Claim 14 wherein said load distribution algorithm distributes new call identity requests in an alternating manner between said first and second identity server applications.

17. (Previously Presented) The wireless network as set forth in Claim 14 wherein said load distribution algorithm distributes new call identity requests according to a current processing load of said first identity server application and a current processing load of said second identity server application.

DOCKET NO. 2002.02.004.NSD
U.S. SERIAL NO. 10/038,872
PATENT

18. (Original) The wireless network as set forth in Claim 17 wherein said load distribution algorithm distributes said new call identity requests in order to maintain said current processing load of said first identity server application at a level substantially equal to said current processing load of said second identity server application.

19. Cancelled.

20. (Previously Presented) The wireless network as set forth in Claim 14 wherein call state information associated with said first primary identity server application is mirrored to said first backup identity server application associated with said first primary identity server application.

21. (Original) The wireless network as set forth in Claim 20 wherein said first backup identity server application resides on said first call application node.

22. (Original) The wireless network as set forth in Claim 20 wherein said first backup identity server application resides on a call application node separate from said first call application node.

U.S. SERIAL NO. 10/038,872
PATENT

23. (Previously Presented) The wireless network as set forth in Claim 14 wherein said second identity server application comprises a second primary-backup group server application, wherein said second primary-backup group server application comprises a second primary identity server application executed on said second call application node and a second backup identity server application associated with said second primary identity server application.

24. (Original) The wireless network as set forth in Claim 23 wherein state information associated with said second primary call process is mirrored to said second backup call process associated with said second primary call process.

25. (Original) The wireless network as set forth in Claim 24 wherein said second backup identity server application resides on said second call application node.

26. (Original) The wireless network as set forth in Claim 24 wherein said second backup identity server application resides on a call application node separate from said second call application node.
